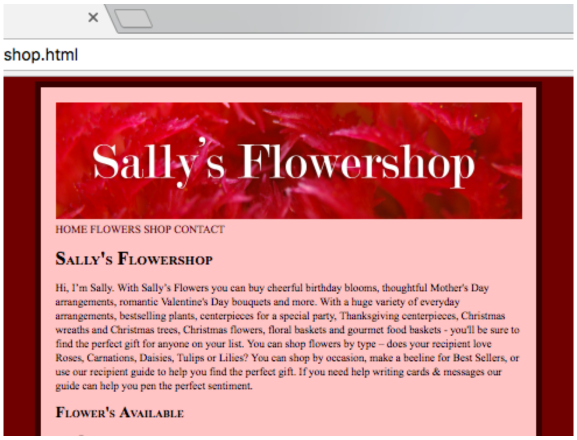
LAB: BUILD A WEBPAGE FOR A FLOWER SHOP

At this point in the course we know enough HTML and CSS that we can begin to plan and build webpages that look fairly professional.

In this lab we will build a webpage for our client Sally's Flowershop. We will overlook the wireframe, as well as look the mockup to get a visual overview of the project before we begin to program it.

Then we will go through the process of structuring the page with HTML and then applying CSS to stylize the webpage.



Sally's Flowershop

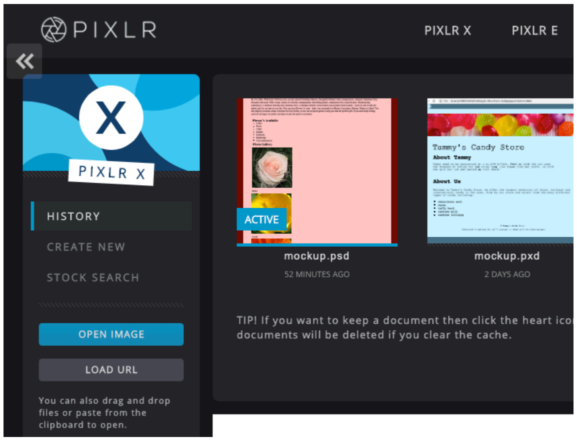
Hi, I'm Sally. With Sally's Flowers you can buy cheerful birthday blooms, thoughtful Mother's Day arrangements, romantic Valentine's Day bouquets and more. With a huge variety of everyday arrangements, bestselling plants, centerpieces for a special party, Thanksgiving centerpieces, Christmas wreaths and Christmas trees, Christmas flowers, floral baskets and gourmet food baskets - you'll be sure to find the perfect gift for anyone on your list. You can shop flowers by type – does your recipient love Roses, Carnations, Daisies, Tulips or Lilies? You can shop by occasion, make a beeline for Best Sellers, or use our recipient guide to help you find the perfect gift. If you need help writing cards & messages our guide can help you pen the perfect sentiment.

Flower's Available

VISUAL OVERVIEW: WIREFRAME AND MOCKUP

Open *Wireframe.pdf* into a PDF reader. This will give you the general overview of what our page structure will be. It involves a main container called .container that is 800px wide and all the text and images lays inside of it.

Open the *mockup.pxd* into Pixlr. You are also welcome to open the *.psd* version in to Adobe Photoshop if you prefer. You'll get a sense of the visual style including color, background colors, typography and spacing.



You can also drag and drop files or paste from the clipboard to open.

TIP! If you want to keep a document then click the heart ico documents will be deleted if you clear the cache.

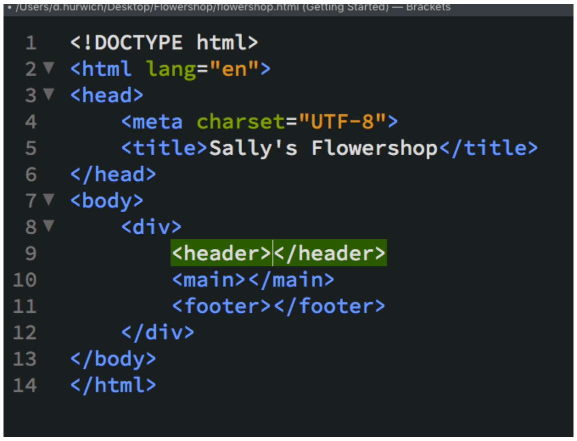
STEP 1: BEGIN TO STRUCTURE WITH HTML

In the root folder you'll find the banner image, flower images and website copy text that we need to build the webpage.

Create a new webpage in Brackets and begin to layout the necessary HTML.

Begin with the necessary HTML tags including the *<!doctype html>*, *<html>*, *<head>*, *<title>*, and *<body>*

Save the webpage as *flowershop.html*



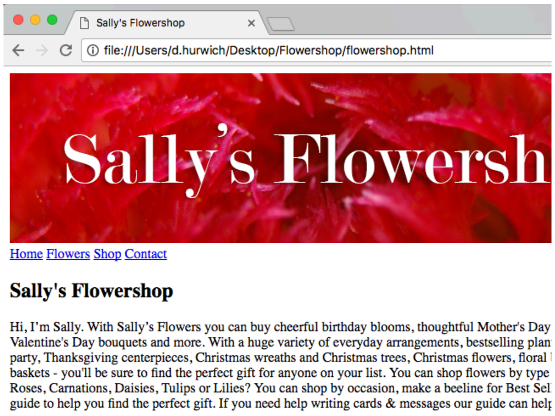
• /Users/d.hurwich/Desktop/Flowershop/flowershop.html (Getting Started) — Brackets

```
<!DOCTYPE html>
<html lang="en">
<head>
    <meta charset="UTF-8">
    <title>Sally's Flowershop</title>
</head>
<body>
    <div>
        <header></header>
        <main></main>
        <footer></footer>
    </div>
</body>
</html>
```

STEP 2: HTML TEXT AND IMAGES

Next add in the HTML for headings, paragraphs, lists and images.

Use the mockup as a guide. Think about visually hierarchy and that larger objects are typically more important than smaller objects.



Sally's Flowershop

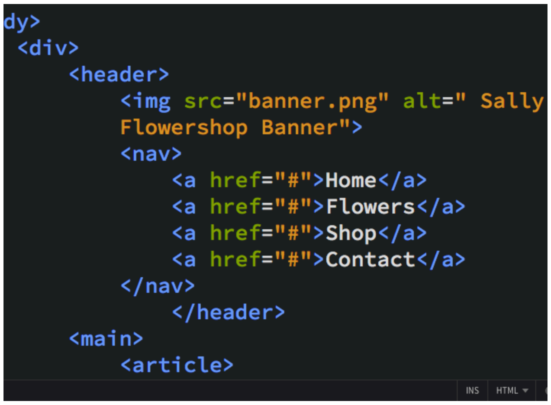
Hi, I'm Sally. With Sally's Flowers you can buy cheerful birthday blooms, thoughtful Mother's Day Valentine's Day bouquets and more. With a huge variety of everyday arrangements, bestselling plan party, Thanksgiving centerpieces, Christmas wreaths and Christmas trees, Christmas flowers, floral baskets - you'll be sure to find the perfect gift for anyone on your list. You can shop flowers by type Roses, Carnations, Daisies, Tulips or Lilies? You can shop by occasion, make a beeline for Best Sel guide to help you find the perfect gift. If you need help writing cards & messages our guide can help

STEP 3: NAVIGATION BAR

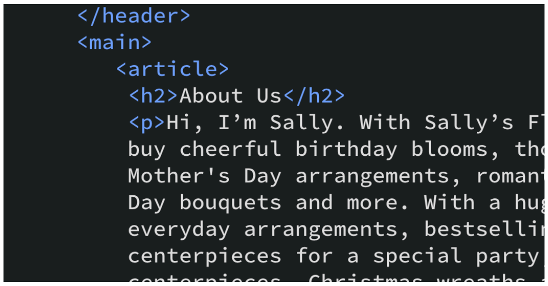


```
dy>
 <div>
     <header>
         <img src="banner.png" alt=" Sally
         Flowershop Banner">
         <nav>
             <a href="#">Home</a>
             <a href="#">Flowers</a>
             <a href="#">Shop</a>
             <a href="#">Contact</a>
         </nav>
             </header>
     <main>
         <article>
```

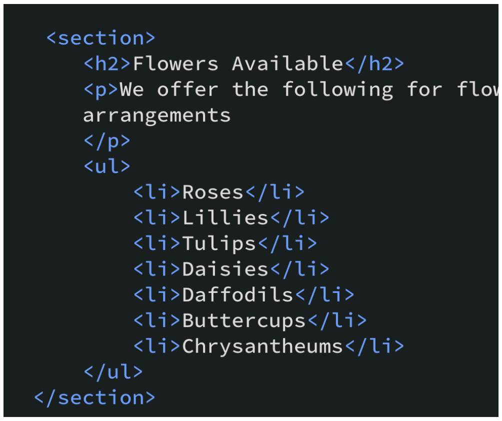
Let's add a navigation bar to the webpage. We will have links for the Home page, Flowers page, Shop page and Contact page. In this lab we'll just use the dummy link option of "#"

Use the *<nav>* tag and add in the four hyperlinks using the *<a>* tag.

STEP 4: HTML CONTAINERS



```
      </header>
      <main>
         <article>
          <h2>About Us</h2>
          <p>Hi, I'm Sally. With Sally's F
          buy cheerful birthday blooms, th
          Mother's Day arrangements, roman
          Day bouquets and more. With a hu
          everyday arrangements, bestselli
          centerpieces for a special party
          centerpieces, Christmas wreaths
```



```
   <section>
      <h2>Flowers Available</h2>
      <p>We offer the following for flo
      arrangements
      </p>
      <ul>
          <li>Roses</li>
          <li>Lillies</li>
          <li>Tulips</li>
          <li>Daisies</li>
          <li>Daffodils</li>
          <li>Buttercups</li>
          <li>Chrysantheums</li>
      </ul>
  </section>
```

Finally, add in the container tags to structure the page. This includes putting the navigation links and banner image into a *<header>*

Put each the webpage body text into an *<article>*

Put the flower options into a *<section>*

Put the flower photos into a *<section>*

Put all of these items in a *<main>* tag to structure the main part of the webpage.

Put the legal information into a *<footer>* tag

Structure the ENTIRE page by putting all of these elements into a *<div>* tag and label the div with a class called *.container*

ADD CASCADING STYLESHEETS

Let's begin adding CSS to this webpage.

Begin by creating a new document in Brackets and saving it as *style.css*. Make sure to save the file into your root folder with your images and HTML file.

Add the following:

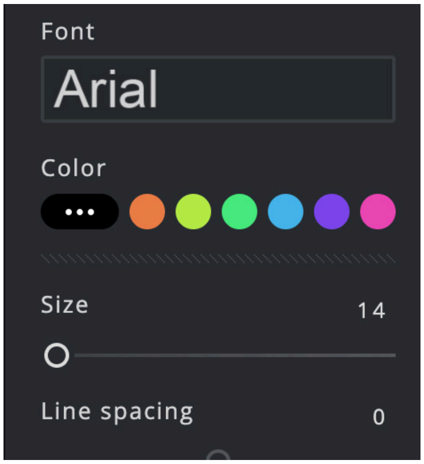
```
h1 {
    color: red;
}
```

Use the <link> tag on the HTML page to link the HTML file to the stylesheet. Test your webpage into a browser. If your heading DOES NOT turn red, double check the your code and that the HTML and CSS files are in the same root folder.

STEP 5: SET TYPOGRAPHY

Now let's begin setting the typography for your webpage.

Open *mockup.pxd* into Pixlr. Use the text tool in the program to look at the typeface and the font size of the elements. You can also see the line-spacing/line-height or the space between your lines.



Font Arial

Color

Size 14

Line spacing 0

On a piece of paper, or sidenote figure out

- Typefaces
- Font Sizes
- Leading/Line-height

Other elements such as,

- Capitalization
- Small-Caps
- Bold
- Italic

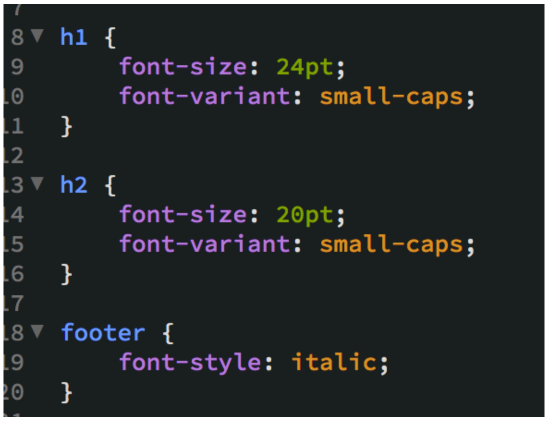
For organization purposes add in a comment into your CSS like this:

`/* typography */`

Use CSS Cascading/inheritance to apply the typeface and default font size to the *<body>* tag. This will cascade or pass down the properties to their children.

Set the font sizes for elements such as heading, captions and footer using CSS rules.

Set other properties such small-caps, capitalization, font color, text-decoration for your text.



```
h1 {
      font-size: 24pt;
      font-variant: small-caps;
}

h2 {
      font-size: 20pt;
      font-variant: small-caps;
}

footer {
      font-style: italic;
}
```

BACKGROUNDS

Now let's start to add in the background colors for the webpage.

For organization purposes add in a comment into your CSS like this:

`/* backgrounds */`

Use the eyedropper tool in Adobe Photoshop to sample

FLOWER'S AVAILABLE

- Roses

For the final step let's add a bit of dimensions, spacing and layout placement using box model properties.

Set the width of *.container* to 800px as indicated by the original wireframe.

Set a border property around the *.container*. Sample the color in Photoshop to match the colors.

Set spacing between the content and the container using the padding property.

Finally, let's set the content to center to the middle of the webpage. To do use the *margin:auto* setup for *.container*.

SUBMIT

Put all the necessary files into a folder including: HTML, CSS and image files. Zip the folder and submit it to Canvas in the appropiate spot.
